

Wind Energy

By Viet Ha

Wind energy

How could wind energy work?

- Wind energy work by using nature wind, the wind push the wheel spin and the turbine start working then it is a kinetic energy of wind then it turn into electrical energy. When the wing spin fast the inside generator start making energy.

Wind power picture

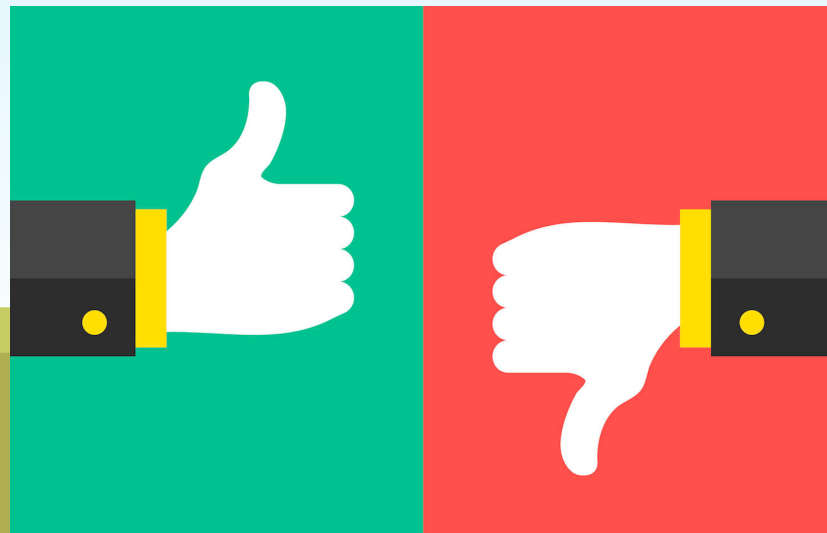

Wind energy farm

The advantage and disadvantage

- The advantage is more than the disadvantage because when you use wind power it is better than using fossil fuel because it is good for the environment. Using the wind nature energy is better for the environment. This energy is very cheap once you had build it. And this energy cause no global warming and pollution. It work in a very large scale because there are a wind farm.
- But the disadvantage is when there are no wind then there are no energy. That is the disadvantage of wind energy.

Are there any question???
